

## Two-sensor cabinet interface device

Part of the Expanse system, the Arc2 is all about convenience—providing power, surge protection, and communications for up to two sensors. Multiple Arc2s can be placed on a single Ethernet network so that, through the Expanse software, you can configure all sensors in your system right from your computer.

- Puts all connected sensors on your Ethernet network, letting you access them from any connected computer via the Expanse software
- SDLC port for communicating with compatible controllers
- RS-485 and Ethernet connections for on-site configuration and connection to other cabinet devices
- Accepts AC power and passes that power on to up to two sensors
- Protects cabinets from surges on the sensor cable
- Field-replaceable Arc Surge cards allow you to quickly get the device back in top condition after a surge event
- Can be set on a shelf or mounted on a cabinet wall or 19-in. rack
